PORTABITI

M E T A L P R O G E T T I

LAUNDRY PROJECT

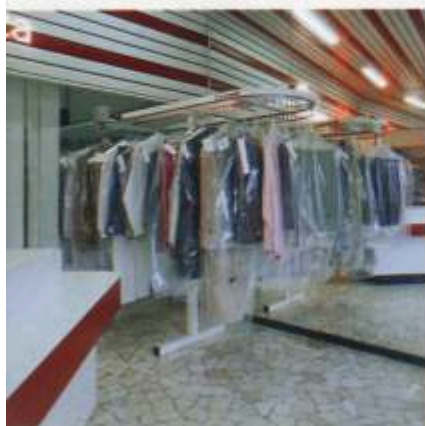

Minimum space, maximum
technical possibilities,
economy and aesthetics.

PC M E T

From the new clothing technologies has come a revolutionary system for handling and storing garments. Long years of working experience, combined with top quality materials and special construction methods guaranteeing perfect operation, have produced this unique aerial steel continuous-rack system for storing garments. The PORTABITI is easy to install and maintain. It cuts space requirements, solves all organization problems, and with its modules of various shapes and sizes can be adapted to one or more levels. It stores hundreds of garments in a minimum area, reduces time for finding individual articles and can be operated by one person. What's more the operator doesn't have to leave the customer service counter but can find a garment quickly and easily with either manual controls or an automatic computerized locating system with keyboard

for calling for the desired articles and positioning them at a preset point. The clothes rack are made in two basic models : C/70 CASELLE with preset spaces for the garments and C/70 CONTINUO based on a continuous band system without predetermined positions. The C/70 CASELLE is also made in the SPIRAL model on two or more levels for a more functional and convenient use of the space in height, while always allowing the operator to work at eye level. The aerial or suspended design also leaves work areas free. The PORTABITI can be personalized to fit all situations. For industrial laundries computerized operation is possible with reading of garment bar codes, automatic transfer unit and sorting and make-up of customer's laundry.

DISCOTHEQUE PROJECT

PORTABITI has begun a new era for the cloak-room. No more lines, waiting or the risk of misplacements, but a modern service in keeping with the times.

This revolutionary system featuring high-tech flexibility solves many space problems, especially for cloak-rooms where space is limited. In addition to the straight or floor or other modules in various forms, there are solutions for installing clothes racks that rise and lower to several levels so that the attendant can always hang and remove garments at eye level. Ladders and benches are no longer necessary.

The **METALPROGETTI PORTABITI** is the only continuous aerial mechanized steel-belt system for hanging customer's coats and returning them in record time with manual or electronic locating controls to eliminate any possible error.

The PORTABITI can be operated by an automatic computerized locator: the number corresponding to the desired sector is digitized on the keyboard and the PORTABITI automatically comes into play and moves the sector or slot corresponding with the requested number to a programmable place near the operator.

The computerized locator provides for keyboard digitizing of the number of the garment or list of garments to be returned and automatically positions the garment or garments in succession in the preset return point. The big advantage of this system, besides its extreme flexibility, is that service personnel never have to leave the counter area. The design of the PORTABITI is personalized and carefully studied to go with any type of interior.

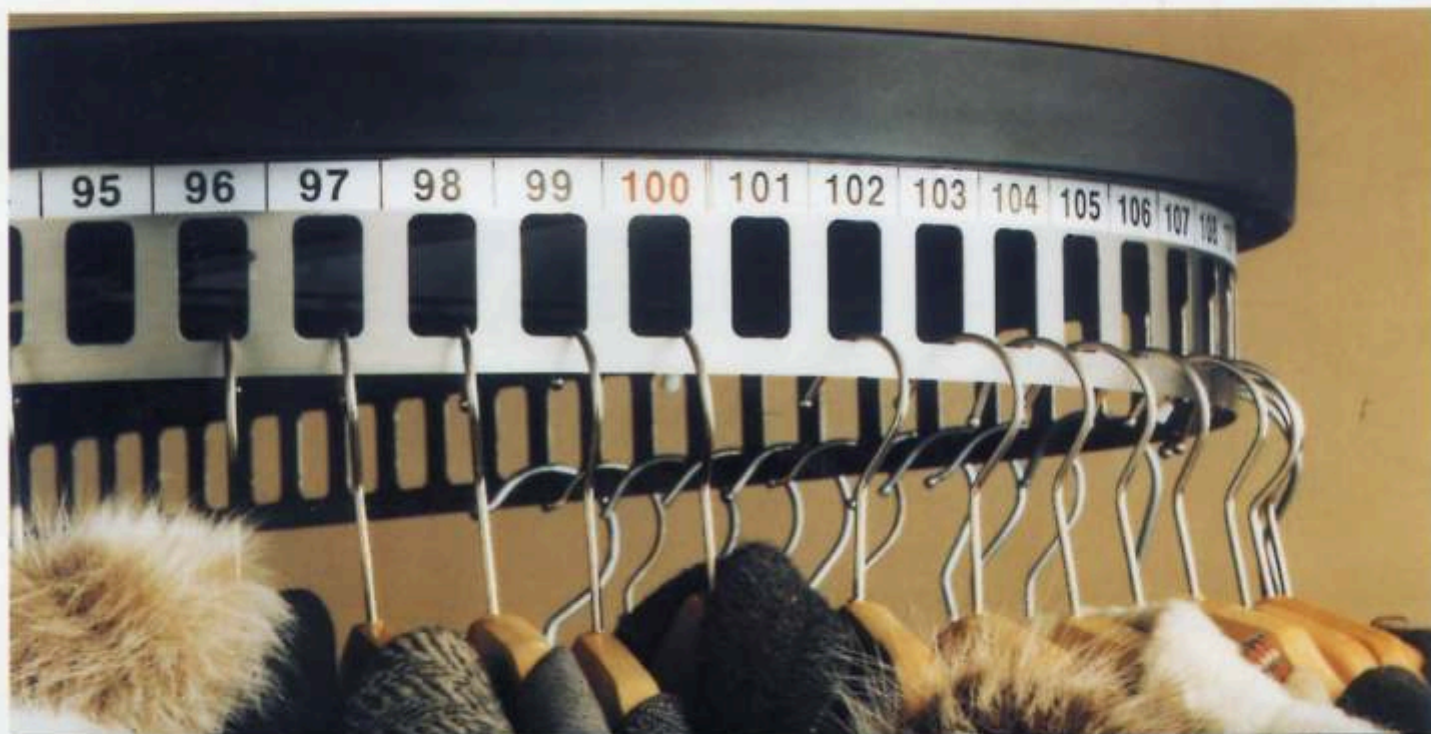

A photograph of a clothing store interior. The ceiling is vaulted and features intricate frescoes in shades of purple, gold, and white. The store is filled with white clothing racks holding various garments, including white shirts and a tan skirt. A large, dark, circular light fixture is visible on the right side of the ceiling. The overall atmosphere is elegant and classic.
